For the requirements prioritization, After we discuss in our group.We prioritize by choosing the necessary main process for the first priority. The business is about online selling. Therefore, view the product, order the product and make payment will come first. Then, the 2nd priority is the requirement that is not about e-commerce but still important. For example, reporting the problem or contacting farms via live chat are important. For the last priority, These requirements are optional. These functions are functions that can make a better experience for customers. For instance, rating function and managing information function will be in this area.
